AI GOAL SAVER

AI-Assisted Savings Goal Management System

PROJECT REPORT

A web-based financial planning application designed to help users define savings goals, monitor progress, review transactions, and receive guidance from an AI savings coach.

Note: This report documents the visible design and intended behaviour shown in the supplied screenshots. Technical choices not visible in the screenshots are described as recommendations or requirements, not as verified implementation facts.

1. ABSTRACT

AI Goal Saver is a proposed web-based application for organizing personal savings goals in one dashboard. The interface brings together a financial overview, total saved amount, active goals, overall progress, a savings portfolio, transaction history, and an AI Savings Coach. Users can create a goal, track milestones, and ask practical questions about saving faster, budgeting, or preparing an emergency fund. The design aims to make saving more structured and understandable by presenting key information clearly and offering contextual guidance. The supplied screenshots show an initial state with no goals or transactions, so this report describes the visible interface and the intended workflow without claiming that unshown banking integrations or AI services have been fully implemented.

2. INTRODUCTION

Managing money can be difficult when a person has several targets, such as buying a laptop, paying education fees, saving for travel, or building an emergency fund. Without a clear plan, it is easy to lose track of how much has been saved and how far a target is from completion. AI Goal Saver addresses this need through a goal-oriented dashboard that presents savings information and guidance in a single place.

The application concept combines standard goal tracking with a conversational savings coach. Its interface uses summary cards and dedicated sections so that users can quickly understand their current status, create a target, and explore ways to improve their savings habits.

3. PROBLEM STATEMENT

Many users manage savings goals informally using notes, spreadsheets, or memory. This can make progress difficult to measure, especially when multiple goals are active. Users may also be unsure how to set a realistic target, prepare an emergency fund, or adjust spending. A simple, organized system is needed to record goals, display progress, and provide accessible educational guidance while keeping the user in control of financial decisions.

4. OBJECTIVES

- Provide a central dashboard for savings information and goal status.
- Allow users to create and track personal savings goals and milestones.
- Show progress indicators that make each goal easier to understand.
- Present transaction history for credits assigned to goals, where transaction data is available.
- Offer an AI Savings Coach interface for general budgeting and savings questions.
- Promote consistent saving through clear, accessible, and user-friendly design.
- Keep financial guidance educational and avoid presenting it as guaranteed or personalized professional financial advice.

5. SCOPE OF THE PROJECT

The project scope, based on the supplied screens, includes the financial overview dashboard, savings-goal management, portfolio summary, transaction-history area, and AI-coach conversation panel. A complete implementation may also include data storage, secure authentication, validation, and optional financial-account integration. These supporting components should be documented and tested only if they are actually part of the submitted application.

Intended users: students, salaried individuals, and other users who want to organize savings targets and understand their progress.

6. PROPOSED SYSTEM AND FEATURES

Financial overview

Shows total saved amount, number of active goals, overall progress, and an AI health-score area. The screenshot displays zero values because no goals have been added yet.

Savings goals

Provides an entry point to add a first goal and separates active goals from completed goals.

Savings portfolio

Summarizes how savings are distributed across goals. It displays an empty-state message until goals exist.

Transaction history

Provides a section for verified credits routed to goals. The visible screen currently has no transactions.

AI Savings Coach

Offers suggested prompts such as saving faster, building a budget, and estimating an emergency fund. Users can type a question in the chat input.

Search and notifications

The header includes a goal-search field and notification icon to support navigation and awareness.

Goal creation

The Add New Goal and Add Your First Goal controls indicate the primary workflow for beginning a savings plan.

7. SYSTEM DESIGN AND WORKFLOW

7.1 High-level architecture

Layer	Responsibility
Presentation layer	Dashboard, goal forms, progress cards, transaction list, and coach chat interface.
Application logic	Validate goal details, calculate saved amount and progress, classify goal status, and process coach prompts.
Data layer	Store user profile, goals, milestones, and transaction records securely if implemented.
External services (optional)	AI service or banking integration, only if configured and supported by the actual project.

7.2 Typical workflow

- User opens the Financial Overview dashboard.
- User selects Add New Goal or Add Your First Goal.
- The application should collect goal details such as title, target amount, target date, and starting amount.
- The application validates the entered information and saves the goal.
- Dashboard cards and portfolio summaries update based on the saved goal data.
- As valid deposits or credits are recorded, the system updates the goal progress and transaction history.
- The user may ask the Savings Coach for general budgeting and savings guidance.

7.3 Example progress calculation

A simple progress percentage can be calculated as: Progress (%) = (Current Saved Amount ÷ Target Amount) × 100. The application should handle a zero or invalid target amount safely and may cap the displayed progress at 100%

while separately showing any amount saved beyond the target.

8. FUNCTIONAL AND NON-FUNCTIONAL REQUIREMENTS

Type	Requirement
Functional	Create, view, update, and complete a savings goal.
Functional	Calculate goal progress from saved and target amounts.
Functional	Display active/completed goals and transaction history when data exists.
Functional	Accept coach questions and show an appropriate response if the AI feature is implemented.
Security	Protect account information and never expose credentials or sensitive banking data in logs or screenshots.
Usability	Use clear labels, readable text, consistent spacing, and understandable empty states.
Reliability	Validate inputs and handle network, data-storage, and AI-service errors gracefully.
Compatibility	Render correctly on common desktop and mobile screen sizes, if responsive support is included.

9. USER INTERFACE SCREENSHOTS

The following figures are taken from the screenshots supplied for this report. They document the visible dashboard layout and the empty initial state.

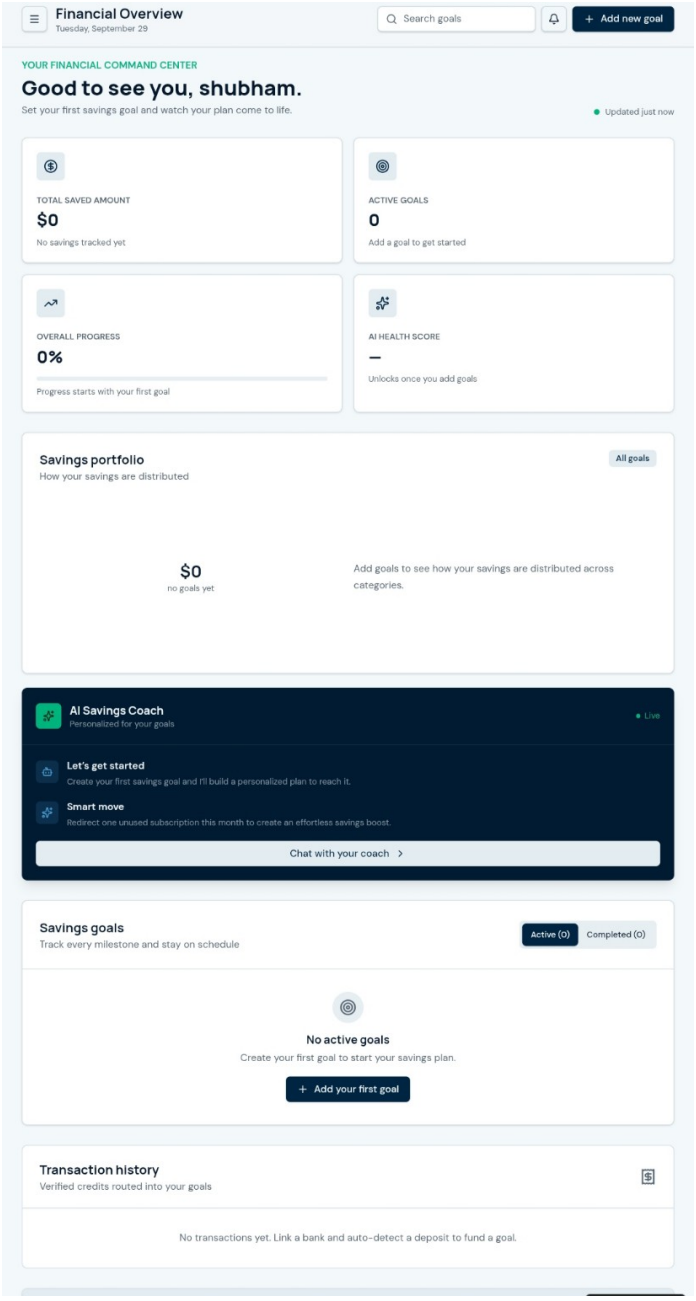

Figure 1. Financial overview with summary cards, savings portfolio, AI Savings Coach, goals, and transaction history.

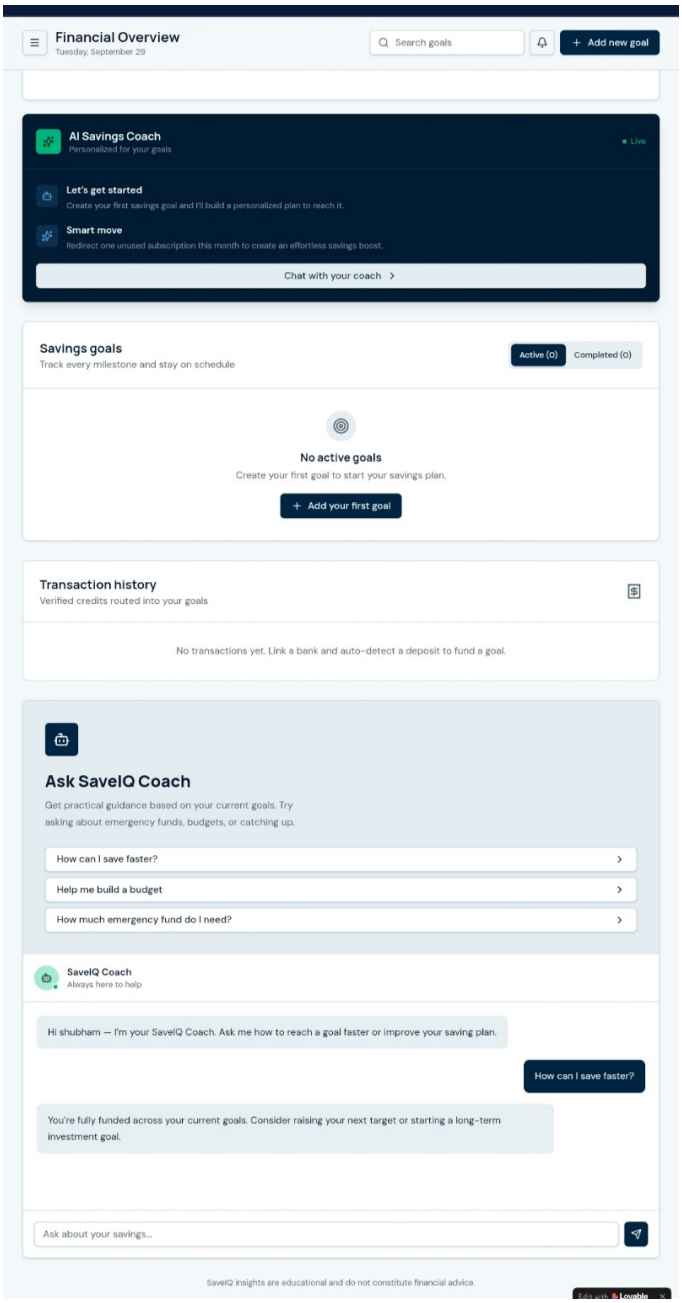

Figure 2. Dashboard view showing the AI Savings Coach, empty savings goals section, and transaction history.

Interface observations

- The navy and light-background colour palette provides visual separation between the main dashboard and the AI coach panel.
- Summary cards present key metrics near the top of the page, helping users scan the current status quickly.
- Empty-state messages explain what to do next rather than leaving the sections blank.
- The goal-creation controls are visible and repeated in context, which supports the primary user task.
- The interface includes an educational disclaimer stating that insights are not financial advice.

10. TESTING AND VALIDATION

The following is a recommended test plan. Mark each case as Pass or Fail only after running it against the actual application; screenshot evidence alone does not prove that all underlying functions work.

ID	Test case	Expected result
T01	Open dashboard with no saved goals	Empty states and zero values appear without errors.

ID	Test case	Expected result
T02	Create a goal with valid details	Goal is saved and appears in the active-goals list.
T03	Submit a blank goal form	Validation message is shown; invalid data is not saved.
T04	Enter a zero/negative target amount	Input is rejected with a clear message.
T05	Record a valid contribution	Saved amount and progress update correctly.
T06	Complete a goal	Goal moves to the completed section and counts update.
T07	Ask a coach question	A response or clear service-error message is displayed.
T08	Open on a narrow screen	Content remains readable and controls are usable if responsive design is supported.

Suggested evidence for repository review

- Attach screenshots of the goal creation form and a successfully created goal.
- Show progress after adding a sample contribution and show the completed-goal state.
- Include a screenshot of a coach response if the AI integration is functional.
- Record the actual technology stack, setup steps, and test results in the repository README.

11. LIMITATIONS AND FUTURE ENHANCEMENTS

Limitations visible from the supplied screenshots

- The dashboard currently shows no active goals, no completed goals, and no transactions.
- The screenshots do not establish whether banking integration, persistent storage, authentication, or a live AI service is connected.
- An AI health score is shown as unavailable until goals are added; its calculation method is not shown.

Future enhancements

- Add secure login and user-specific storage for goals and transactions.
- Provide recurring contribution schedules, reminders, and milestone notifications.
- Offer charts for monthly savings trends and goal-wise distribution.
- Improve accessibility with keyboard navigation, labels, and adequate colour contrast.
- Add transparent explanations for any AI-generated score or recommendation.
- If bank linking is implemented, use a trusted provider, obtain explicit consent, and explain what data is accessed.

12. CONCLUSION

AI Goal Saver presents a clear concept for helping users organize savings goals and understand their progress. Its dashboard brings together financial summaries, goal tracking, transaction history, and a conversational savings coach. The supplied screenshots demonstrate the user-interface structure and useful empty-state guidance. To make the project submission complete and reliable, the actual implementation should be verified against the functional requirements, testing cases should be executed, and the repository should include accurate setup instructions and evidence of working features. The application should be positioned as an educational planning aid rather than a replacement for professional financial advice.

13. REFERENCES AND SUBMISSION CHECKLIST

References

- Project UI screenshots supplied by the project author (used as primary visual evidence).
- Official documentation for the framework and database actually used by the project (add the exact links before submission).
- Official documentation for any AI API or financial-data provider actually integrated (add only if applicable).

Before submitting

- Replace all blank cover-page fields with correct academic details.
- Confirm the project name and describe the actual technology stack (for example, frontend, backend, database, and AI service).
- Run the test cases and replace the proposed test plan with real Pass/Fail results.
- Add screenshots of working features, not only the empty dashboard.
- Check your department's required report format, certificate/declaration pages, and plagiarism rules. No report can guarantee acceptance; accuracy and compliance with your institute's format are essential.
